The following notation is used in this table:

Symbol	Operation
C	Carry/link flag. C=1 if the operation produced a carry from the MSB of the operand or result.
Z	Zero flag. Z=1 if the result of the operation is zero.
S	Sign flag. S=1 if the MSB of the result is one.
P/V	Parity or overflow flag. Parity (P) and overflow (V) share the same flag. Logical operations affect this flag with the parity of the result while arithmetic operations affect this flag with the overflow of the result. If P/V holds parity, P/V=1 if the result of the operation is even, P/V=0 if result is odd. If P/V holds overflow, P/V=1 if the result of the operation produced an overflow.
H	Half-carry flag. H=1 if the add or subtract operation produced a carry into or borrow from bit 4 of the accumulator.
N	Add/Subtract flag. N=1 if the previous operation was a subtract.
†	H and N flags are used in conjunction with the decimal adjust instruction (DAA) to properly correct the result into packed BCD format following addition or subtraction using operands with packed BCD format.
•	The flag is affected according to the result of the operation.
†	The flag is unchanged by the operation.
0	The flag is reset by the operation.
1	The flag is set by the operation.
X	The flag is a "don't care".
V	P/V flag affected according to the overflow result of the operation.
P	P/V flag affected according to the parity result of the operation.
r	Any one of the CPU registers A, B, C, D, E, H, L.
s	Any 8-bit location for all the addressing modes allowed for the particular instruction.
ss	Any 16-bit location for all the addressing modes allowed for that instruction.
ii	Any one of the two index registers IX or IY.
R	Refresh counter.
n	8-bit value in range <0, 255>
nn	16-bit value in range <0, 65535>

## Z80 – CPU INTERRUPT STRUCTURE

### MASKABLE (INT)

#### Mode 0

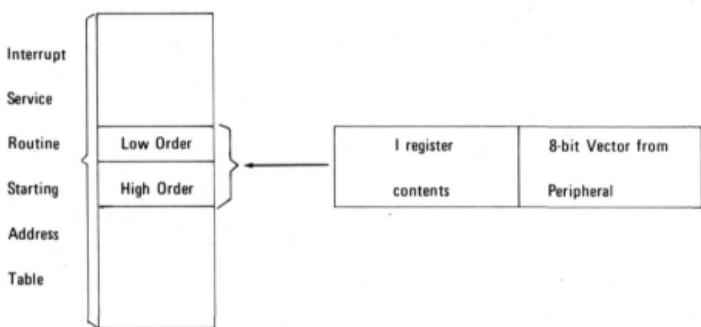

Place instruction onto Data Bus during  $\overline{\text{INTA}} = \overline{\text{MI}} + \overline{\text{IORQ}}$  like 8080A

#### Mode 1

Restart to 38H or 5610 ('RST 56')

#### Mode 2

Used by Z80 Peripherals

### NON MASKABLE (NMI)

Restart to 66H or 10210

### INTERRUPT ENABLE/DISABLE FLIP-FLOPS

## STATUS AFFECTS VECTOR (D2) (FROM WRITE REG 1)

If this mode is selected, the vector returned from an interrupt acknowledge cycle will be variable according to the following:

	V3	V2	V1	
Ch B	0	0	0	Ch B Transmit Buffer Empty
	0	0	1	Ch B External/Status Change
	0	1	0	Ch B Receive Character Available
	0	1	1	Ch B Special Receive Condition
Ch A	1	0	0	Ch A Transmit Buffer Empty
	1	0	1	Ch A External/Status Change
	1	1	0	Ch A Receive Character Available
	1	1	1	Ch A Special Receive Condition

If this bit is 0, the fixed vector programmed in the vector register is returned.
